1. The problem

1.1. Impersonal passives in German and Dutch

German and Dutch vary considerably with respect to the distribution of the expletives\textsuperscript{1} es and er, respectively in impersonal passives. While German es is only allowed in sentence-initial position (1), the presence of Dutch er is much less restricted (2), in fact (apart from the sentence-initial position where it is obligatory), er seems to be completely optional.

(1) a. *(Es) wurde getanzt.  
\hspace{1cm} Expl was danced  
“There was dancing.”/“People were dancing.”

b. … daß (*es\textsuperscript{2}) getanzt wurde.  
\hspace{1cm} … that Expl danced was  
“... that there was dancing.”/“… that people were dancing.”

c. Gestern wurde (*es) getanzt.  
\hspace{1cm} yesterday was Expl danced  
“Yesterday, there was dancing.”/“Yesterday, people were dancing.”

(2) a. *(Er) wordt gedanst.  
\hspace{1cm} Expl is danced  
“There is dancing.”/“People are dancing.”

b. … dat (er) wordt gedanst/gedanst wordt.\textsuperscript{3}  
\hspace{1cm} … that (Expl) is danced/danced is  
“… that there is dancing.”/“… that people are dancing.”

c. Op het schip wordt (er) gedanst.  
\hspace{1cm} on the ship is (Expl) danced  
“On the ship, there is dancing.”/“On the ship, people are dancing.”

\textsuperscript{1} I’d like to thank Hans Kamp for kindly providing me with Dutch data and for discussing his intuitions with me and the audiences of the GGS 2003 in Cologne and the CGSW 2003 in Durham for their comments. All errors are, of course, mine.

\textsuperscript{2} I use the term “expletive” here because es and er are standardly referred to as expletives and I always gloss er as Expl (expletive), no matter what its actual nature is.

\textsuperscript{3} The presence of es can be grammatical, namely if es is a real pronoun standing for e.g. das Ballett ‘the ballet’.

\textsuperscript{3} I assume that gedanst wordt (i.e. the word order we find in German) represents the order derived in narrow syntax, while wordt gedanst is due to reordering at PF because the choice of word order is solely determined by prosody (Hans Kamp, p.c.).
1.2. Transitive Expletive Constructions (TECs) in German and Dutch

German and Dutch both allow for TECs and at first sight the constructions look identical in the two languages. They vary, however, in one important respect. In Dutch, we observe a Definiteness Effect (DE) with respect to the subject of a TEC, whereas no such DE is found in German TECs (contrary to what has often been claimed, cf. Cardinaletti 1990). The only requirement is that the subject be rather specific – *der Mann ‘the man’ instead of *der Kanzler ‘the chancellor’ in (3b) would be highly marginal.

(3) a. Es haben einige Kinder Spinat gegessen. (German)
   "Several children have eaten spinach."

   b. Es hat soeben der Kanzler die Bühne betreten.
   "The chancellor has just mounted the platform."

(4) a. Er heeft iemand een appel gegeten. (Dutch)
   "Someone has eaten an apple."

   b. *Er heeft zo-even de kans elier het toneel betreden.
   "The chancellor has just mounted the platform."

These differences can be accounted for if *er is analysed as the overt instantiation of an event argument.

2. Preliminary remarks – two subject positions in the Split-IP

(5) a. Diesen Satz haben schon immer alle Studenten gehaßt. (German)
   "This sentence, all students have always hated."

   b. *Diesen Satz haben schon immer die Studenten gehaßt.

   c. ?Diesen Satz haben alle Studenten schon immer gehaßt.

   d. Diesen Satz haben die Studenten schon immer gehaßt.

Assuming that the adverbs occupy a fixed position, the above examples show that there are two subject positions in the *Mittelfeld, one above the adverb and associated with definite
subjects (and marginally with indefinite and quantified subjects) and one lower than the adverb and associated with indefinite and quantified subjects, but never with definite subjects.

I propose that the lower position is SpecTP and the higher position SpecRefP (following Kiss 1996).

3. **Expletive es**

- *Es* is merged in SpecCP⁴, the sentence-initial position, to satisfy the V2 requirement if no other XP is merged in or moves to SpecCP.

- *Es* is a pure expletive. This means that, in German, it can only be merged in SpecCP.
  ⇒ There is neither an empty counterpart of *es* (*pro* as assumed among others by Cardinaletti 1990 and Vikner 1995) in SpecTP nor can *es* move from an IP-internal position to SpecCP because
    (i) SpecTP is always filled by (remnant) vP⁵
    (ii) SpecRefP is not available for *es* because we can get definite DPs in TECs

  ⇒ Therefore it is not surprising that *es* is not available in (1b), where SpecCP is not projected at all, and (1c), where SpecCP is filled by the adverb *gestern* ‘yesterday’.

4. **Er cannot (only⁶) be an expletive**

- *Er* cannot be an expletive because it is not semantically empty as can be seen in (6) where the impersonal passives with and without *er* vary in interpretation.

  (6) De voorstelling kwam maar heel stroef op gang.           (Dutch)
      *the show came only very slowly on going*
      "The show got off to very grinding start."

a. Maar op het laatst werd gelachen.
   *but on the last was laughed*
   "But in the end the audience laughed."

b. Maar op het laatst werd er gelachen.
   *but on the last was Expl laughed*
   "But in the end there were some people who laughed."

  ⇒ The implicit agent of impersonal passives without *er* (6a) is a contextually known or inferable entity (here: the audience of the show).
  ⇒ The presence of *er* (6b) restricts the implicit agent to an indefinite subset of that entity (here: some people in the audience of the show).⁷

---

⁴ For the sake of simplicity I use CP here. I assume, however, that we actually have a Split-CP (Rizzi 1997) with sentence-initial subjects and certain sentence-initial adverbs usually occupying SpecFinP, whereas sentence-initial objects have to occupy either SpecFocP or SpecTopP.

⁵ see section 7

⁶ see section 6.2.
5. **The idea**

- Thetic sentences = answers to the question *What happened?*, out-of-the-blue sentences
- Thetic sentences report on events. ⇒ All arguments of the verb are introduced as event participants. ⇒ No argument of the verb can serve as subject of predication. ⇒ Thetic sentences can optionally contain a location-goal argument (cf. *there* in *There arrived three men.*) (Cardinaletti 2002)
- Wrto the *there*-construction as an example of a thetic construction Kiss (1996) proposes the following.

> *There* constructions always predicate about a specific point in space and time: about “here and now”, or “there and then”. *There* may then be the spelling out of the deictically or contextually bound event argument referring to the given point in space and time, in which case it is expected to have the feature `<+specific>`.

Kiss (1996, 135)

- Following Kiss (1996) and Cardinaletti (2002) I propose that Dutch can optionally feature such an event argument and that this event argument is realised by *er*.

6. **Er as an event argument**

6.1. **TECs – thetic sentences**

- TECs are thetic sentences because the complete event is the predicate.
- In Dutch, TECs require an event argument.
  ⇒ *Er* is merged in SpecRefP, the designated position for definite subjects (cf. Kiss’ (1996) assumption that the event argument carries the feature `<+specific>`), and moves to SpecCP.
  ⇒ As SpecRefP is not available for the subject DP, we can only have indefinite subjects in TECs; hence the Definiteness Effect is accounted for. (If *er* were an expletive, i.e. merged in SpecCP, the Definiteness Effect could not be explained.)
  ⇒ The Definiteness Effect reflects the thetic nature of these sentences which convey novelty of the situation.
- The analysis of *er* as an event argument, or in Cardinaletti’s (2002) terms as a location-goal argument, is supported by the fact that *er* is historically derived from the distal locative demonstrative *daar* ‘there’.
- Therefore the construction in question should not be called TEC (transitive expletive construction) but TEAC (transitive event argument construction) in Dutch.

6.2. **Impersonal passives**

- *Er* – if present – is merged in SpecRefP.
  ⇒ Hence the implicit agent of an impersonal passive (leaving aside the question of how the implicit agent actually gets its interpretation) can only have the indefinite interpretation, i.e. the implicit agent can only refer to the indefinite subset of the contextually known or inferable entity.

---

7 Not all speakers of Dutch get this differentiation (Jeroen van Craenenbroeck, Henk van Riemsdijk, Jan-Wouter Zwart p.c.).
The specific interpretation of the implicit agent is only available if *er* is absent from the structure.

- In embedded clauses and in main clauses where some other XP occupies SpecCP, the presence/absence of *er* depends on the interpretation that is to be conveyed by the sentence.
- If no other XP occupies SpecCP, however, *er* is obligatory. As (7) only has an indefinite interpretation, I conclude that also in this case *er* is an event argument merged in SpecRefP. The only difference being that in this case the presence of the event argument is obligatory because it also assumes the function of an expletive. In other words, if the event argument *er* is not present and no other XP can satisfy the V2 requirement, the derivation will crash because there is no expletive *er* that could be merged directly in SpecCP (and which would therefore allow for a definite interpretation of the implicit agent).

\[(7) \quad \text{Er werd gedanst.} \quad \text{(Dutch)} \]

*Expl was danced*

“Some people (at the party) were dancing.”, **not:** “All people (at the party) were dancing.”

7. **Structural analysis**

Illustrated with the derivation of (the slightly modified) example (3b):

(a) Es betrat der Kanzler die Bühne. \quad \text{(synthetic tense)}
(b) Es hat der Kanzler die Bühne betreten. \quad \text{(compound tense)}

- The internal argument DP is merged in SpecVP.
- vP is obligatory. The external argument is merged in SpecvP; vP, however, does not have a specifier if the verb is passive or unaccusative.
- In OV-languages (like German and Dutch) the finite verb moves to T and the (remnant) vP moves to SpecTP.
  (i) a. \[\text{TP} [\text{vP der Kanzler die Bühne betrat}] \text{betrat} <\text{vP}>]
  (i) b. \[\text{TP} [\text{vP der Kanzler die Bühne betreten}] \text{hat} [\text{AuxP} <\text{hat}> <\text{vP}>]]
- If the subject is definite/specific it moves to SpecRefP. In this case, the finite verb moves to Ref in main clauses, but stays in T in embedded clauses.
  (In Dutch, the event argument *er* (if present as, e.g., inTECs) is merged in SpecRefP ⇒ DE.)
  (ii) a. \[\text{RefP} [\text{DP der Kanzler}] \text{betrat} [\text{TP} [\text{vP <der Kanzler> die Bühne betrat}] <\text{betrat} <\text{vP}>]]
  (ii) b. \[\text{RefP} [\text{DP der Kanzler}] \text{hat} [\text{TP} [\text{vP <der Kanzler> die Bühne betreten}] <\text{hat}> [\text{AuxP} <\text{hat}> <\text{vP}>]]]
• In main clauses the finite verb moves to C and some XP moves to SpecCP or expletive es is merged in SpecCP. In embedded clauses, the complementiser, e.g. daß, is merged in C. [In Dutch TEC main clauses, the event argument er moves to SpecCP.]

(iii)  a. \([\text{CP Es betrat} \text{[RefP dp der Kanzler]} \text{<betrat}> \text{[TP [vP <der Kanzler> die Bühne <betrat>]} <\text{betrat}> <\text{vP}>]}]]\)

(iii)  b. \([\text{CP Es hat} \text{[RefP dp der Kanzler]} <\text{hat}> \text{[TP [vP <der Kanzler> die Bühne betreten]} <\text{hat}> [\text{AuxP <hat> <vP}>]}]]\)

embedded clause:
(iv)  a. \([\text{CP daß [RefP dp der Kanzler]} \text{Ref [TP [vP <der Kanzler> die Bühne <betrat>]} <\text{betrat}> <\text{vP}>]}]]\)

(iv)  b. \([\text{CP daß [RefP dp der Kanzler]} \text{Ref [TP [vP <der Kanzler> die Bühne betreten]} hat <\text{hat}> [\text{AuxP <hat> <vP}>]}]]\)

8. **German again … and open questions**

• The distribution of *da* (which is equally of locative origin) slightly resembles that of *er*, as can be seen in (8).

(8)  a. … daß da getanzt wurde.
    … *that DA danced was*
    “… that there was dancing.”/“… that people were dancing (there).”

    b. Gestern wurde da getanzt.
    yesterday was  DA danced
    “Yesterday there was dancing.”/“Yesterday people were dancing (there).”

• The true nature of *da* is, however, hard to determine.
  • It is not devoid of meaning (as indicated in (8)) and can therefore not be an expletive.
  • It has probably not (completely) undergone the step from being a locative to being an event argument yet.
  ⇒ Although *da* might also restrict the interpretation of the implicit agent, it still has a locative flavour (as indicated in (8)).
  ⇒ If *da* cooccurs with a(nother) locative, it is either interpreted as a distal demonstrative (9a, c) or has a resumptive nature (9b, c).

(9)  a. Auf dem Schiff da wird getanzt.
    *on the ship DA is danced*
    “On the ship over there there is dancing.”/“On the ship over there people are dancing.”
b. Auf dem Schiff, da wird getanzt.
   "On the ship, there is dancing."/"On the ship, people are dancing."

c. [Es ist bitter zu wissen, was er draußen verpaßt!]
   [it is bitter to know what he outside misses-out-on]
   ["It is bitter to know what he misses out on in the outside world."]

Während er hier einen streng geheimen Schlagbaum bewacht,
"While he guards a top secret barrier here

wird da draußen getanzt und geliebt und gelacht.
"Out there, people are dancing, making love and laughing."

(from: Reinhard Mey, “Alle Soldaten woll’n nach Haus“)

- The fact that da can occur together with a definite subject (even in constructions that look exactly like TECs) suggests that da cannot be an event argument merged in SpecRefP.

(10) Da hat der Ministerpräsident eine mitreißende Rede gehalten.
   "The Prime Minister gave a rousing speech."

The translation of da also constitutes a problem. On the one hand, – given the right intonation and preferably the presence of the particle aber – (10) can express appreciation ("Wow! The Prime Minister has given a rousing speech."). In this case, one could argue that da is a particle that marks illocutionary force (exclamative) (Guido Mensching, p.c.).

On the other hand, da can simply spell out “there and then” like the event arguments identified by Kiss (1996) ⇒ “On that occasion, the Prime Minister gave a rousing speech.”. Despite its event argument-like interpretation, I suggest that here da is (still) an adverb.⁸

---

⁸ If da were an event argument merged in SpecRefP, one would expect that it is incompatible with individual level predicates (like kennen ‘know’), whose subjects occupy SpecRefP, while it should be compatible with stage level predicates (like geboren werden ‘be born’), whose subjects sit in SpecTP (Peter Öhl and Eva-Maria Remberger, p.c.).

(i) a. … weil da Jungen die Romane von Karl May kennen.
   "… because boys know the novels by Karl May (there)"

b. … weil da Jungen geboren werden.
   "… because boys are born (there)."

The question is whether this test really proves that da is an event argument. Da is certainly fine with the stage level predicate in (ib) but I find it extremely hard to get any other reading (i.e. a thetic one) than the one where da is a pure locative.

In addition, (ia) is a grammatical sentence as well but again, da can only have a locative reading (and one is tempted to add noch ‘still’).
The assumption that we have to do with different kinds of *da* in (10) is supported by the fact that the *da* which shows up in constructions which have been analysed as optionally featuring an event argument does not go together with a definite subject.

(11) a. *Ich gebe ab, weil *da* der Kanzler die Bühne betreten hat.  
    *I give away because DA the chancellor the platform entered has*  
    “I’ll stop here because the chancellor has mounted the platform.”

b. *Ich gebe ab, weil *da* ein Amerikaner die Bühne betreten hat.  
    *I give away because DA an American the platform entered has*  
    “I’ll stop here because an American has mounted the platform.”

• There are other instances where *da* seems to behave like an event argument.  
Imagine, for example, a teacher standing in front of a class and uttering the following sentences.

(12) a. *Wer hat gelacht?*  
    “Who has laughed?”

b. *Wer hat *da* gelacht?  
    *who has DA laughed*  
    roughly: “Who has dared to laugh?”

In (12a), the teacher asks for the name(s) of the student(s) who laughed without any other semantic or pragmatic implications. So the question without *da* requires a definite referent as an answer.

In (12b), on the contrary, the teacher does not necessarily ask for names; instead (12b) is more or less a reproach which implies that some student(s) laughed, thus referring to an indefinite number of students out of a definite set of students.

⇒ While German *es* and Dutch *er* represent clear-cut cases of an expletive and an event argument, respectively, the nature of German *da* is less clear. *Da* is certainly not an expletive but it has characteristics of both a locative adverb and an event argument. In addition, at least some of the features that make *da* look like an event argument can also be explained by its locative nature. Therefore we probably witness the locative *da* being reanalysed as an event argument.

(ii) *In Sachsen kann man Winnetou aufführen, weil *da* Jungen die Romane von Karl May in Saxony can one Winnetou stage because there boys the novels of Karl May (noch) kennen.*  
    *still know*  
    “In Saxony one can stage Winnetou because boys (still) know the novels by Karl May there.”
